The Input Space $\mathfrak X$

- ullet Our general learning theory setup: no assumptions about ${\mathcal X}$
- But $\mathfrak{X} = \mathbf{R}^d$ for the specific methods we've developed:
 - Ridge regression
 - Lasso regression
 - Linear SVM

Feature Extraction

Definition

Mapping an input from \mathfrak{X} to a vector in \mathbb{R}^d is called **feature extraction** or **featurization**.

Raw Input

Feature Vector

$$\mathcal{X} \xrightarrow{x} \overset{\text{Feature}}{\underset{\text{Extraction}}{\longrightarrow}} \frac{\phi(x)}{\underset{\mathbb{R}^d}{\longrightarrow}} \mathbb{R}^d$$

ullet e.g. Quadratic feature map: $\mathfrak{X} = \mathbf{R}^d$

$$\phi(x) = (x_1, \dots, x_d, x_1^2, \dots, x_d^2, \sqrt{2}x_1x_2, \dots, \sqrt{2}x_ix_j, \dots \sqrt{2}x_{d-1}x_d)^T.$$

High-Dimensional Features Good but Expensive

- To get expressive hypothesis spaces using linear models,
 - need high-dimensional feature spaces
- But more costly in terms of computation and memory.

Some Methods Can Be "Kernelized"

Definition

A method is **kernelized** if inputs only appear inside inner products: $\langle \phi(x), \phi(y) \rangle$ for $x, y \in \mathcal{X}$.

The function

$$k(x, y) = \langle \phi(x), \phi(y) \rangle$$

is called the kernel function.

Kernel Evaluation Can Be Fast

Example

Quadratic feature map

$$\phi(x) = (x_1, \dots, x_d, x_1^2, \dots, x_d^2, \sqrt{2}x_1x_2, \dots, \sqrt{2}x_ix_j, \dots \sqrt{2}x_{d-1}x_d)^T$$

has dimension $O(d^2)$, but

$$k(w,x) = \langle \phi(w), \phi(x) \rangle = \langle w, x \rangle + \langle w, x \rangle^2$$

- Naively explicit computation of k(w,x): $O(d^2)$
- Implicit computation of k(w,x): O(d)

Recap

- Given a kernelized ML algorithm.
- Can swap out the inner product for a new kernel function.
- New kernel may correspond to a high dimensional feature space.
- Once kernel matrix is computed, computational cost depends on number of data points, rather than the dimension of feature space.
